ALL PRODUCTS CONTAIN LESS THAN 0.3% THC.
WEIGHT MEASUREMENTS INDICATE TOTAL CBD.

Bulk Sales

Mountain Flower Botanicals is a bulk product producer. We will sell our high-quality, always-consistent product to re-sellers by the case in 30-milliliter glass bottles with dropper-tops and sanitary shrink-wrap sealing sleeves -- ready for their labels.

Each bottle is stamped on the bottom with the Extract Batch Number, the Tincture Batch number and the expiration date of the MCT oil used (if tincture).

Our bulk-sales products come with full and complete Certificates of Analysis from accredited laboratories which attest to their purity, safety, and potency.

The products are formulated using best practices in a large, new, licensed kitchen using Good Manufacturing Practices from extract professionally made from our own plant material using pure ethanol. The lab results which we provide prove that the extract batch used in each case is free from all residual pesticides, solvents, and any microbial contamination.

All ingredients are organic and of the highest quality.

About Us

Our product is made from hemp flower grown right here on our 66-acre farm 5 miles from Hotchkiss, CO using a strain bred by our owner, Jan VanDenBerg, called Colorado Queen.

We farm all-organic using the freshest, purest irrigation water from the top of Grand Mesa. We have been breeding, farming and formulating products with our hemp since the legalization of hemp in Colorado in 2014.

Mountain Flower Botanicals is proud to be one of two hemp breeders in the world to have a high-CBD certified hemp strain, called "Medicine Mother." It was certified by the State of Colorado Dept of Agriculture in 2018. The strain, grown field-method, will yield 6% CBD fully seeded up or it can be grown female-only to yield 12% CBD. We are working on more strains, including one that matures in only 120 days.

We sell retail online at mountainflowerbotanicals.com. We also sell wholesale, with our label, to retailers or to those who buy 12 units. We also produce and sell in bulk, white (no)-label, by the 100-count case.

Usage Suggestions

CBD and CBDa (raw, unheated CBD, as it comes off the plant) are produced inside the body (as are THC and THCa) and are absolutely essential to the proper functioning of the bodies of most animals, including humans.

Cannabinoids produced by the body for its own use are called endocannabinoids; those from the cannabis (and a few other) plants are called phytocannabinoids. They are absolutely identical in molecular structure. This is why there are nearly no side effects to using them and there is no known overdose level (other than getting too high on THC, THCa, CBD and CBDa do not make a person high).

Cannabis is said to be one of the first plants domesticated by humans and it is possible that mankind and cannabis evolved together to be useful to one another.

CBD has been widely shown by scientists and to the experienced to be useful for pain and anxiety relief and as an anti-seizure and anti-cramping agent. It has also been shown by studies to reduce some cancers and to improve bone growth. It is an "immune system modulator," which means it will turn down the immune response if it's excessive (allergies, autoimmune disorders, asthma) and will turn UP the immune response if it's sluggish (chronic infections).

Most scientific studies have tended to use 200mg a day as a full, therapeutic dose, though those who suffer from serious maladies like Parkinson's, MS and epilepsy will use even more than that. The FDA has approved pure, crystalline CBD for the treatment of epilepsy; the molecule is identical to that found in hemp extract. Some people respond well to microdoses as low as the 10 to 15 mg common on most gummy bears and the like. Usually, that is going to be too low a dose for a full response by a human, though pets can be calmed by a dose as low as 1mg.

CBDa is the acid form of CBD; this is how the compound comes off the raw plant and, if carefully kept cool during processing, products containing mostly CBDa can be produced. CBDa is seen as an anti-inflammatory, so useful in salves for arthritis, psoriasis, acne and all inflammation near the skin. CBDa can be taken orally in tinctures for reduction in systemic inflammation, which is the underlying cause of heart attacks and strokes. Changes in diet (no Omega-6 oils) and the use of CBDa tincture may further reduce systemic inflammation.

Usually, tinctures are taken sublingually -- under the tongue. No swallowing for a minute or so. The solution passes through the mucous membranes of the mouth and enters directly into the bloodstream, bypassing potentially damaging stomach acids.

Usage Suggestions (cont'd)

Usage Suggestions (cont'd)

Each bottle contains 30ml and a completely full dropper should contain 1 mL. There are 30 1-ml dropperfuls in each bottle. So, if a bottle is 1000mg, one dropperful will be one-30th of that, or 33mg. It would take 6 dropperfuls per day to get the kind of therapeutic dose that could be effective against epilepsy or Parkinson's, though higher doses may be warranted for sufferers from these serious maladies. One dropperful of the 3000mg tincture would, then, deliver one-30th of 3000 or 100mg. So, 2 dropperfuls of that per day would be a generous dose of 200mg per day. Remember, there is no risk of overdose and no side effects, as CBD is manufactured by the body itself and is totally natural.

Nothing stated here has been examined by the FDA. The FDA has not evaluated our products for safety or efficacy. Our products are not intended to diagnose, treat, cure or prevent any disease. Consult your physician before use.
